A Network That Works Independently

Unlike conventional Wi-Fi setups, the Provision-ISR Wi-Fi CCTV Kit creates its **own dedicated wireless network** between the NVR and four 4MP IP cameras, **independent of the customer's router.**

Dedicated Network
Independent of the local Wi-Fi router

Reliable Transmission
Dedicated connection for consistent video transmission.

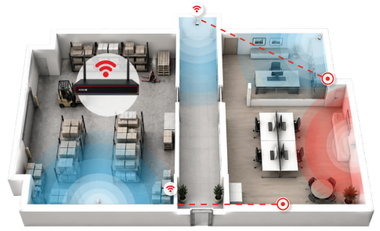
Simplified Installation
Less network cabling and faster setup.

From simple layouts to challenging installations, the network adapts to the site.

Flexible Connections. Built In. One kit. Three ways to connect.

Star Mode

Cameras connect **automatically and directly** to the NVR.
Ideal for straightforward installations.



Cascading Mode

Cameras relay the wireless signal to extend coverage beyond the NVR's direct connection.

Multi-Level Cascading

Multiple cameras relay the signal in sequence, providing flexibility across more challenging layouts.

Automatic Setup. Installer Control.

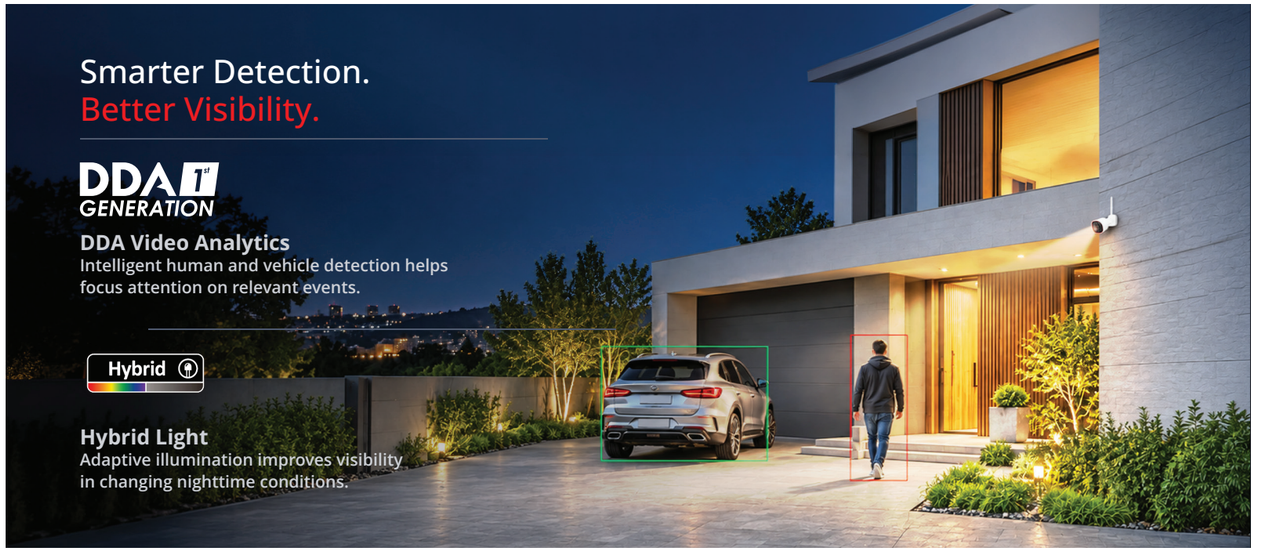
The Wi-Fi Kit establishes wireless connections automatically, while giving installers the flexibility to monitor and adjust the network when needed.

Signal Strength
Monitor each camera's wireless signal.

Connection Overview
See how cameras are connected.

Manual Connection Control
Choose camera connection paths.

Network Optimization
Fine-tune connections for each site.



Wired and Wireless. One System.

The NVR also **supports standard wired IP cameras,** allowing you to combine wired and wireless cameras in the same installation.
